

THE PROBLEM

SE pre-call research is a quota tax

Every qualified account requires hours of manual research across SEC filings, news, job boards, procurement portals, federal databases, and campus safety reports. Most SEs skip it or settle for generic AI summaries that could describe any company in the vertical.

2-4 hrs

SE PREP TIME PER QUALIFIED ACCOUNT

0

SOURCE CITATIONS FROM CHATGPT / CLAY / SALES NAV

Generic AI research produces plausible-sounding briefs that lack source attribution, miss vertical-specific signals (NCES, Clery, FRPL), and generate discovery questions that could apply to any account. The SE can't trust the output without re-verifying every claim.

HOW IT WORKS

One command. Four phases. Sourced brief.

COLLECT

18 source clients run in parallel. Each returns structured JSON with retrieved_at timestamps. Cache-aware with per-source TTLs.

Leadership

named people

ANALYZE	3 Sonnet subagents (company-bg, tech-and-pain, hiring-signals) process source data in parallel. Each outputs structured JSON with confidence tags.
ENRICH	Champion signals client scores named individuals on role fit, tenure, career arc, public voice, topic affinity, authority. Weighted scoring per persona file.
SYNTHESIZE	Opus synthesizer merges all outputs against the persona rule engine. Fires trigger-matched discovery questions. Builds MEDDIC. Renders HTML brief.

BRIEF OUTPUT INCLUDES

✓ TL;DR (3 bullets, 30-sec skim)

✓ MEDDIC qualification (7 fields, evidence + gaps)

✓ Discovery questions (per persona, trigger-sourced)

✓ Champion candidates (scored, with validation Qs)

✓ Cooperative purchasing (contract #s, competitor tiers)

✓ GTM strategy (land play, POC, channel, bundle)

✓ Displacement intel (vendor hits + counter text)

✓ Open questions (gaps for discovery to fill)

WHAT'S DIFFERENT

Not another AI wrapper

Source attribution on every claim
Every factual claim carries [source_url, retrieved_date]. Claims without sources are tagged [INFERENCE] or dropped. Footnote chips link directly to the source.

Anti-genericness engine
Specificity rewrite pass rejects any sentence that could appear unchanged in a brief about a different company. "Insufficient data" beats filler.

Persona-filtered discovery
Discovery questions are generated from trigger templates in the persona file, filled with account-specific data, then filtered by buyer persona (care_about / skip_topics).

MEDDIC qualification overlay
Every brief includes a complete MEDDIC framework with named champions, evidence arrays, confidence tags, and gap analysis per field.

Champion projection
Named individuals scored on 6 weighted factors from public signals. Not a guess — a structured hypothesis with validation questions.

Vendor-agnostic architecture
Swap verkada-se.yml for cisco-se.yml. Triggers, personas, displacement targets, and champion criteria are all config — not code.
